

## Dig Dog

**Program Name: digdog.java**

**Input File: digdog.in**

Bailey is a bad dog sometimes. Sometimes she doesn't always dig where her owner likes. Given a layout of the owner's yard, determine if Bailey has dug in a spot that would make the owner angry.

### Input

The first line will contain a single integer  $n$  indicating the number of datasets. Each dataset will consist of 3 components:

1. The first line will contain a single integer  $m$ , representing the length and width of the yard.
2. The next  $m$  lines represent the layout of the yard, where each line contains  $m$  characters. A numeric character represents a spot that would make the owner angry if Bailey dug there. Acceptable digging spots are represented by periods ('.').
3. The next  $m$  lines represent the layout of the yard, where each line contains  $m$  characters. An "X" character represents a spot where Bailey dug.

### Output

For each data set, if Bailey has dug in a spot that would make the owner angry, display the string "BAD DOG". Otherwise, display the string "GOOD DOG".
